Quax Board Game Sprint 1– How to Run

1. Requirements
• **Java JDK:** OpenJDK 25
• **JavaFX SDK:** 21.0.10Ensure JavaFX is downloaded and the `lib` folder path is known.

2. Launching the Game
Open a terminal/command prompt in the folder containing `COMP20050-Quax.jar` and run:

```
java --module-path /path/to/javafx-sdk-21.0.10/lib --add-modules javafx.controls,javafx.fxml -jar COMP20050-Quax.jar
```

Replace `/path/to/javafx-sdk-21.0.10/lib` with the actual path to your JavaFX SDK `lib` folder.
This will open the Quax board game UI.

3. How to Play
• The board has 11×11 tiles (octagons and rhombics).
• Black moves first, White moves second.
• Click on an empty octagon or rhombic to place your stone.
• Turn indicator at the bottom shows whose turn it is.
• Tiles already occupied cannot be played on.

4. Notes
• The game logic has been tested with **JUnit 5 unit and integration tests.**
• The JAR requires JavaFX modules to run, so the `--module-path` and `--add-modules` options are necessary.
